A multi-omics DMP template for facilities A collaboration of French bioinformatics communities

Frédéric Brau (MICA, IPMC) <u>0000-0001-5967-5895</u>

Jean-François Dufayard (CIRAD, IFB) 0000-0002-7427-6822

Paulette Lieby (IFB) <u>0000-0002-9289-9652</u>

Oana Vigy (PPM, ProFl) <u>0000-0001-5315-1812</u>

AZUR OF

Today

- → A Data Management Plan (DMP) for facilities
- → Collaboration of French communities in bioinformatics in developing a multi-omics DMP for facilities
- → DSWalfB
- → The multi-omics DMP: a presentation

IFB

- → Institut Français de Bioinformatique (IFB) French Institute in Bioinformatics
- → the French umbrella for communities in bioinformatics
- → the French ELIXIR node

What is a facility DMP?

- → Helps an entity managing the data it manipulates
 - service provider to research projects, research laboratory, repository...
- → Addresses research data management (RDM) issues relevant to the aspects of the data life cycle under control of the facility
- → A facility DMP has no set time span
 - as opposed to a DMP describing RDM of a research project which has a defined lifetime

Interlinked facility DMP and project DMP

facility DMP

project DMP

Interlinked facility DMP and project DMP

Which new research projects are requiring our services?

How will our needs as a facility evolve?

How many new users and project spaces are there to manage?

What is the expected facility load?

facility DMP

project DMP

Which tools to generate data?

Which tools to analyse and store data?

What are the characteristics of these tools?

What are the fees?

How to fill my DMP with these informations?

Facility DMP templates: where are they available?

- → On <u>DMP-OPIDoR</u>, the French DMP support tool (an extension of DMPRoadmap)
 - originally as a text-based template
 - from V4.0 (released beginning of April 2024), as a machine actionable template
- → On <u>DSW@IFB</u>, an instance of <u>DSW</u> hosted by the IFB
 - more on this below

A facility DMP template for multi-omics How did it all start?

- → In 2019, IFB, FBI, and EMBRC-FR start on a project developing a facility DMP targeted at bioimaging data
 - ♦ IFB is the French Institute of Bioinformatics and the French ELIXIR node
 - FBI is France Bioimaging and the French node of Euro Bioimaging
 - EMBRC-FR is the French node of European Marine Biological Resource Centre
- → See <u>specifications</u> (in FR)
- → Today this project has expanded to include customisation for multi-omics data
- → The project is funded by IFB

A facility DMP template for multi-omics

- → It started with a Science Europe template customised by IN2P3 (National Institute of nuclear and particle physics), courtesy of DMP-OPIDoR, the French DMP support tool
- → DMP template development achieved via continuous iterations
 - ♦ workshops/discussions/proposals/feedback ↔ implementation
 - workshop: consists, for a specific community, to fill the DMP using the template in its current state
 - a (private) gitlab repository tracks the changes (requests, poorly designed questions, etc...)
 through issues

A DMP template for multi-omics: who is involved?

- → Currently, the following communities are involved in developing the multi-omics template
 - bioimaging (through FBI)
 - genomics (through France Génomique, the genomics French infrastructure)
 - proteomics (through ProFI, a proteomics French infrastructure)
 - cytometry (through l'Association Française de Cytométrie (AFC)
 which organises cytometry services in France)
 - metabolomics (through MetaboHub, the French infrastructure in metabolomics)

A DMP template for multi-omics: principles

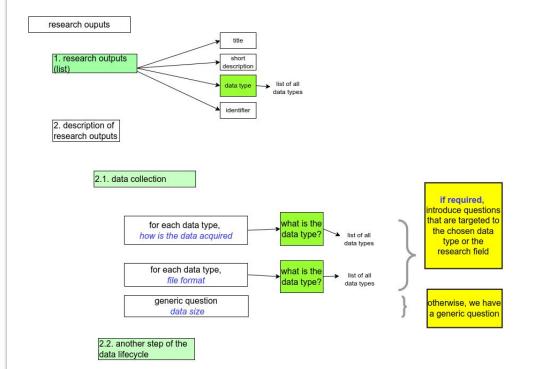

- → The template aligns with the Science Europe template
 - ♦ RDM issues are organised as per the data life cycle
- Only one template is developed
 - structured to allow for a field specialisation (bioimaging, etc...)
 - tags are used to allow the selective display of the questions according to the chosen field
- → It can be cloned and further customised to user needs
 - however, these customisations are not meant to be integrated back in the parent template unless via DMP filling workshops

An ever evolving DMP template

An evolving template: following the data life cycle steps, specialising if required

the question list follows steps in the data life cycle: if a question requires answers that are specific to a data type or research field, a choice of answers is given accordindly:

nro

* it is the steps in the data life cycle that structure the DMP template * the solution is scalable: if required, it is enough to introduce the required flexibility as soon as the question demands it

con:

repeating blocks of questions (which each requiring targeted answers) may appear cumbersome

The tool used: DSW@IFB

- → <u>DSW@IFB</u> is the IFB instance of Data Stewardship Wizard (<u>DSW</u>)
- → DSW:
 - ◆ Development from 2016 onwards, principally by ELIXIR-CZ
 - ◆ The tool originates in the Netherlands from a hierarchical mind map from Dr Rob Hooft of the Dutch Techcentre for Lifesciences (DTL) that organised all data management related information (see The DSW Story | Data Stewardship Wizard)
 - ◆ DSW is an ELIXIR tool, added to the <u>ELIXIR Recommended Interoperability Resources</u> registry in December 2023

Why DSW?

- → DSW provides us with a tool designed to create DMP templates
- → DSW allows collaboration
 - ♦ as well in DMP template creation
 - than in filling in DMPs
- → Straightforward migration
 - of DMP templates when they evolve
 - and of DMPs based on the templates
 - both use versioning
- → All these features make DSW the ideal tool for our iterative DMP

DSW@IFB

- → The <u>site</u> is hosted by IFB and administered by IFB and ourselves
- → Access is open to all (and free, of course...!)
- → There is an accompanying site (in FR) https://ifb-elixirfr.gitlab.io/fair/dsw-ifb-instance/ with some tutorials and other documents, mainly presentations
- → Since March 2024, it is listed on the Service Delivery Plan registry for ELIXIR-FR

DSW@IFB and the DMP template: a short overview

→ access to DSW@IFB

→ caution:

- some of the interface is in French
- the tool interface comes in a few languages
- for the purpose of this presentation, we'll choose English

L'IFB anime depuis fin 2019 un groupe de travail autour du développement d'un modèle de PGD destiné à différentes thématiques en sciences de la vie (bioimagerie, etc...). Aujourd'hui (14/03/2024) ce modèle intègre des détails spécifiques à la bioimagerie, la génomique, protéomique, cytométrie et la métabolomique.

Seriez vous interessé-e-s par ce groupe de travail, par exemple pour explorer d'autres thématiques en sciences de la vie, il vous suffit de nous contacter.

Bienvenue!

DSW@IFB

À la création de votre compte votre rôle est par défaut «Researcher» / chercheur-se ; c'est à dire vos droits vous donnent accès aux projets/questionnaires auxquels vous avez été invité-e-s à collaborer. Vous pouvez aussi créer et gérer des projets/questionnaires.

Si vous désirez endosser le rôle de «Data Steward», (gestionnaire de données), vous permettant de créer et gérer des modèles de PGD, adressez vous à l'un.e des administrateur-rices du site : contact. Ou plus simplement, utiliser le bouton 'Signaler un problème' pour faire votre demande (une fois logué-e).

Nous avons un site accompagnateur DSW @ IFB

On y trouve tutoriels et autres documents.

DSW: concepts and vocabulary

The DMP template

→ the template IFB:pgd-structure:2.x.x

PGD structure développé par l'IFB 2.4.12

pgd-structure · 🏞 IFB:bioimage-fbi-embrc-pgd-structure-km:1.4.17

The DMP template: an overview

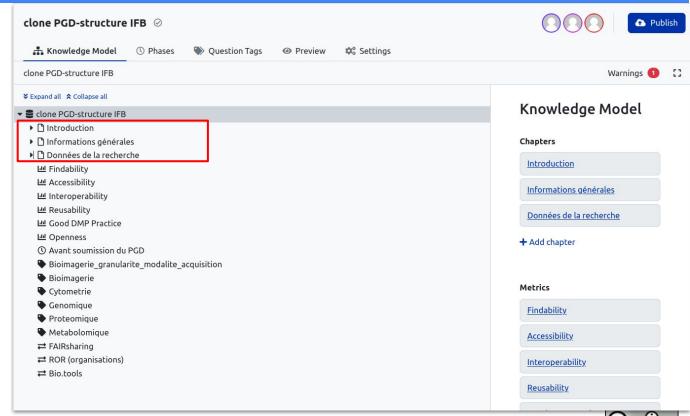

- ▼ **S** clone PGD-structure IFB
 - ▼ [] Introduction
 - ▼ Pour chaque domaine disciplinaire, informations supplémentaires
 - O Informations supplémentaires par domaine disciplinaire
 - ▼ ☐ Informations générales
 - ▶ Informations sur la structure
 - ▶ Personnes et/ou entités assumant des rôles et responsabilités pertinents à la gestion des données
 - ▶ Information sur le PGD
 - ▼ 🖺 Données de la recherche
 - ▶

 D Les produits de la recherche
 - ▼ Description des produits de la recherche
 - ▶

 → Par qui sont générées les données ?
 - Q Génération des données
 - Documentation et qualité des données
 - Q Gestion des données chaudes et tièdes
 - Q Gestion des données froides
 - Questions autour du cadre légal et éthique
 - ▶ Si connu, quel est le mode de financement du(des) produit(s) de la recherche?

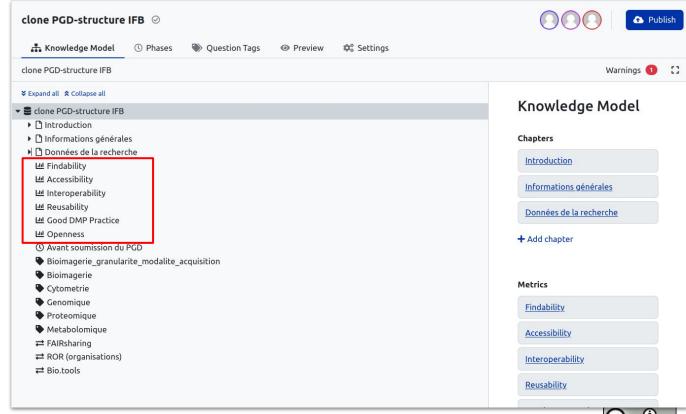

- chapters and questions:
 - follow the Science Europe template

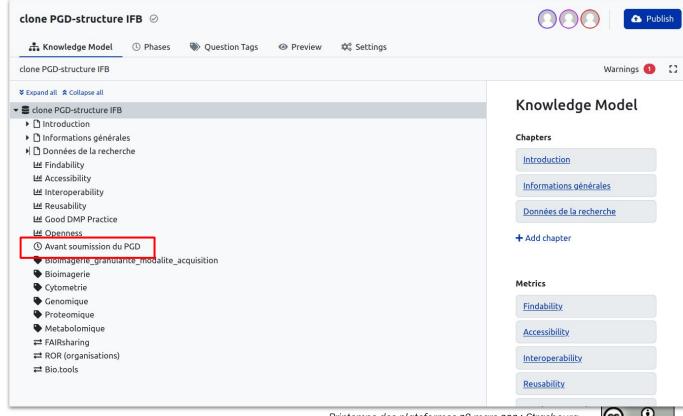

- tags: will help us to selectively choose questions based
 - on chosen fields
 - required detail

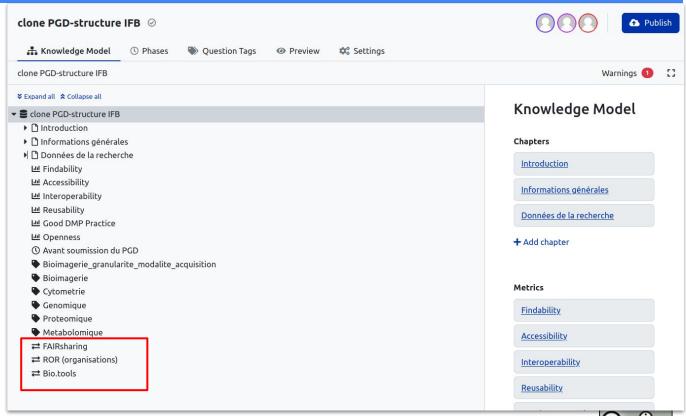

- → metrics:
 - not implemented

- → phases:
 - not implemented
 - only one available currently

- → API integrations:
 - a few are present
 - would be great to have more

Using tags for flexibility

→ Today (March 2024), five fields, i.e. five tags

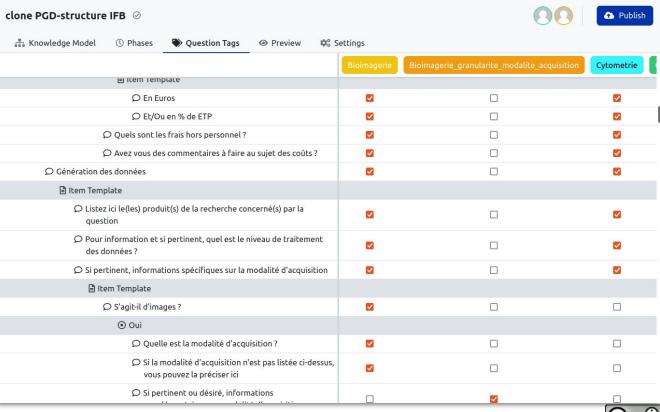

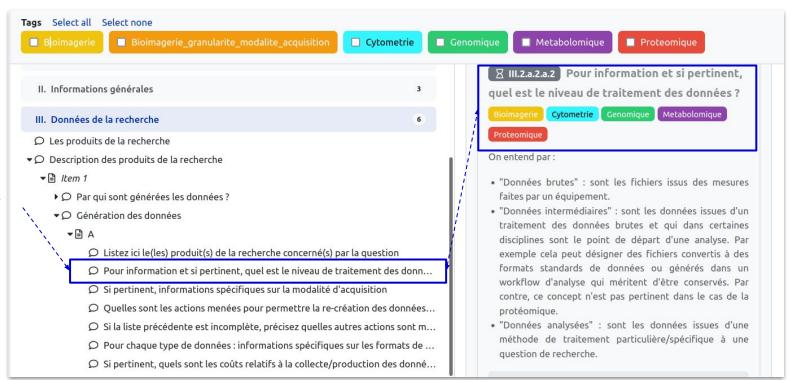

→ and another one for granularity

```
■ Bioimagerie_granularite_modalite_acquisition
```

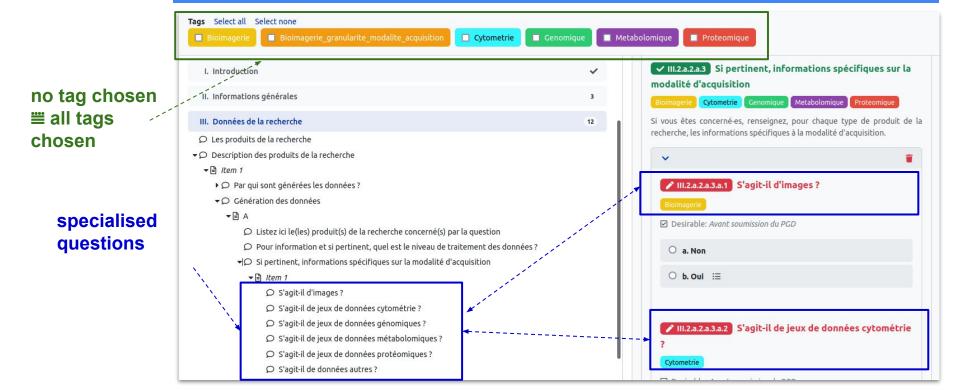

- → CAREFUL:
 - today we equate research fields and data types, for simplicity
 - it is clear that this is meant to evolve in the future to obtain a matrix data types / research fields

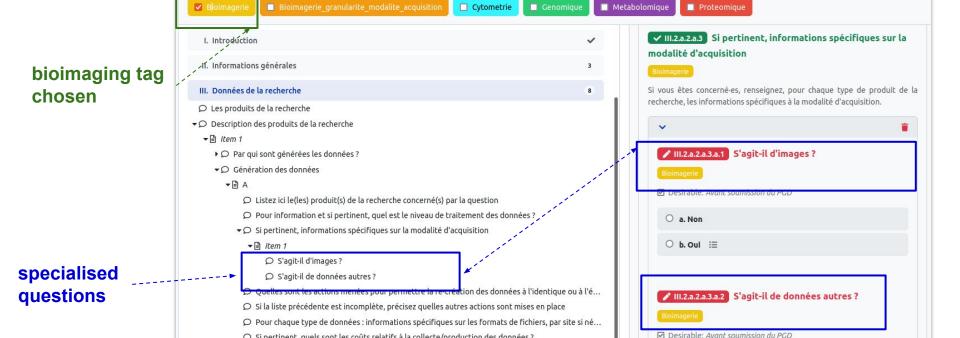

a generic question

O Si pertinent, quels sont les coûts relatifs à la collecte/production des données ?

O Documentation et qualité des données

O Gestion des données chaudes et tièdes

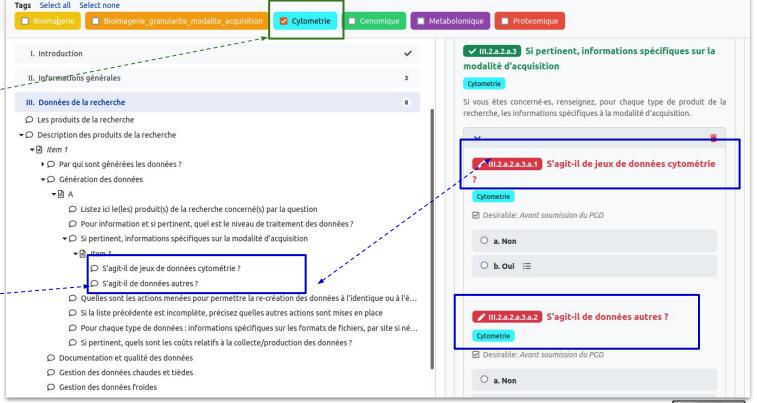

ags Select all

O a. Non

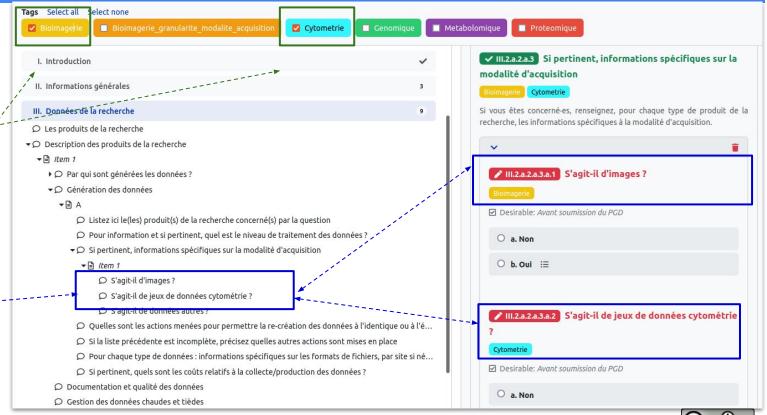

specialised questions

both bioimaging et cytometry tags chosen

specialised questions

Flexibility for research fields

- → We have seen there are two types of questions
 - the generic ones for all fields
 - the specialised ones for specific fields
- → We have seen that adding new disciplinary fields is 'easy'
 - by using tags
 - and easily adding the relevant questions
 - plus taking care of interoperability features (harder not covered here)

Interoperability: maDMP

- → the filled DMP is entirely machine actionable (maDMP)
 - one can export any field value for further processing
 - it is a bit harder to import data but there are a few means to do this
 - and a full set of APIs are available
- how to implement data export (e.g. for further import in another tool)
 - it is not an easy task, given DSW properties (semantics, rationale and structuration) that give a lot of freedom when filling the DMP, and the assumptions we may make
 - e.g. currently there is no proper enforcement of required answers (do we even want enforcement?)
 - requires serious programming work (in jinja2 currently, maybe one day in python?)
 - the point is to write the document model that extracts data to specifications

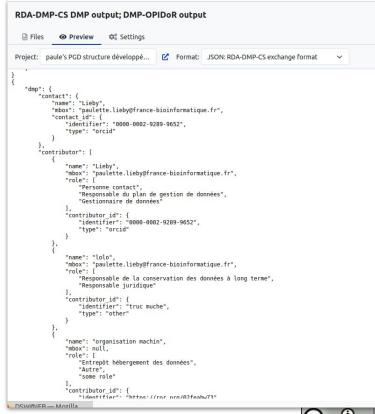

Interoperability: Where are we at?

- Currently: mapping to <u>RDA</u> <u>DMP Common Standard for</u> <u>machine-actionable Data</u> <u>Management Plans</u>
 - using annotations of DSW entities (questions, choices, options, ...)
 - programming the ouput/document template (we have full control over it – see

https://gitlab.com/ifb-elixirfr/fair/g t2-is1-mudis4ls/output-templates)

- → Later: mapping to DMP-OPIDoR's data dictionary
 - richer than RDA-DMP-CS
 - but RDA-DMP-CS compatible

Some numbers

- → We held 25+ preparatory workshops to construct the DMP model
- → and specialised workshops
 - 6 for bioimaging
 - ♦ 3 for genomics
 - ♦ 2 for cytometry
 - ◆ 3 for proteomics
 - 6 for metabolomics
- → There are around 40 facilities having filled their DMP

Perspectives

- evolution of the DMP template as new research communities join the collaboration
- 2. completion of the current interoperability work
 - a. to formally engage in a DSW-DMP-OPIDoR joint effort
- mature our emerging discussion around the interaction facility DMP ↔ project DMP
 - a. the discussion is already in place with various actors:
 - i. Le comité pour la science ouverte
 - i. Data focus group for French national infrastructures in Life Sciences
 - ii. DMP-OPIDoR (V4.0)
 - iii. DSW
 - iv. ..

THANK YOUS....
